

Engraving machine for wedding rings

Our classic in a modernized version – now with font stretching device and optimized quick setting of font size and stretching.

- Easy and intuitively operable machine for the inside engraving of wedding rings and rings with jewels
- Stepless variation of the font size between 1 and 3 mm (via adjusting screw and clear scale)
- Font stretching up to 50 % (for short names the font can be stretched by up to 50 %)
- Wide range of optional accessories, such as different fonts, templates, special characters and monograms
- Good for gold, silver, platinum and stainless steel

The easy handling and accurate engraving is what has made the Ringstar the favourite engraving machine of many. It takes only minutes to learn how to operate the machine. Particularly the various script fonts turn any engraved name into something special. The parameters font size and stretching degree can be set via scales so that every engraving style is perfectly reproducible.

On the new machines, the precision mechanics have been perfected and an integrated font stretching device up to 50 % has been added as special novelty. The stretching degree is steplessly variable according to individual requirements so that even short names can be beautifully engraved.

The stepless setting of the font size (1 – 3 mm) via adjusting screw can be done either through the scale directly to 20 mm font, or with monograms and logos by an indicated factor. The indication of the settings make all parameters reproducible so that pairs of rings can receive identical engravings.

Example for font stretching
